### POS Store & Forward - Managing All Your Sales Information

Barrington Software Inc. has now released POS Store & Forward 3.02 available for Toshiba's TEC FS2700/3600 and TEC Crystal Point and Datasym's DX-890 and SX-700/800 terminals and COMM2000. POS Store & Forward is integrated with Barrington Software's inventory control applications, CookenPro for Hospitality and BSI Inventory Control for Retail, as well as BSI Accounting Bridge for sending sales information to QuickBooks.

POS Store & Forward is software that captures Point of Sale (POS) information, stores that information for a designated number of days, makes it available to other applications, transfers it to additional destinations, and does reporting. Captured text files can be forwarded to an FTP location and Emailed to up to 3 e-mail addresses as attachments without operator intervention. The software is designed to easily interface to multiple manufacturers' terminals.

### Local Office

For the local hospitality or retail operations, POS Store & Forward can capture end of day files, send them to management, and keep them indefinitely. Setup is simple. Users assign a personality: **Datasym Hospitality**, **Datasym COMM2000**, **TEC FS2700/3600** or **TEC Crystal Point**, to a register with a click. The register personality is all information required for data capture and daily reporting. Multiple terminal types can be assigned at the same store or location. For the small shop owner, this software can be used to automatically send daily Sales Detail to the owner's accountant.

### Management Headquarters

Since POS Store & Forward can FTP or Email files at the time of capture, central management can receive the sales information files at essentially the same time as the local retail or hospitality operation, virtually eliminating under reporting of sales by the units. This occurs without operator intervention or knowledge of the transfer. POS Store & Forward scales to 100 stores or registers.
